Catchy article titles can make all the difference. The difference between your blog post getting 1000's of views or sinking into obscurity. When people find your blog post in the search results, it's the title that determines whether they click through to your page and read your article. According to Moz, 80% of readers never make it past the headline. But how do you write article titles that readers will click on? That's exactly what I'm going to show you in this article: 21 formulas for writing catchy article titles that readers click on. Quick Navigation. 1. Use Numbers. 3. The theme of the article is closely connected with title of the article 4. This article deals with, is devoted to 5. The main idea is expressed in the first (the last) paragraph. 6. At the beginning the author describes, explains, introduces, analyses, gives a review of, comments on, enumerates, points out 7. From the article we learn that 8. At the end the author comes to the conclusion that 9. To my mind (in my opinion) 10. As far as I know, understand, remember 11. For all I know 12. First of all, to began with 13. The thing (problem, fact, point) is 14. On the one hand, on the

A good Wikipedia article title has the five following characteristics: Recognizability – The title is a name or description of the subject that someone familiar with, although not necessarily an expert in, the subject area will recognize. Naturalness – The title is one that readers are likely to look or search for and that editors would naturally use to link to the article from other articles. Such a title usually conveys what the subject is actually called in English. – Editors should also consider all five of the criteria for article titles outlined above. Ambiguous or inaccurate names for the article subject, as determined in reliable sources, are often avoided even though they may be more frequently used by reliable sources. Neutrality is also considered; see – Neutrality in article titles, below. The input file is just a plain text file, with the extension .tex. It will contain code that the computer interprets to produce a PDF file. The first line of code declares the type of document, in this case is an article. Then, between the `\begin{document}` `\end{document}` tags you must write the text of your document. Note: To learn how to generate the output file see our article on compiling. Open an example in Overleaf. – To display the title of your document you have to declare its components in the preamble and then use some additional code:

```
\documentclass[12pt, letterpaper, twoside]{article} \usepackage[utf8]{inputenc} \. title{First document} \author{Hubert Farnsworth} \thanks{funded by the Overleaf team} \date{February 2014} \. begin{document} \.
```
